                                                                             5041
                                                                                                                                                                                                                                                                                                                                                                                                      5281
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PATENT NO. 9.25.95.97

FATENT NO. 9.25.95.97

FATENT NO. 9.25.95.97

FITLE OF INVENTION: PRODUCTION OF INFECTIOUS RESPIRATORY

TITLE OF INVENTION: PRODUCTION OF INFECTIOUS RESPIRATORY

TITLE OF INVENTION: SINCYTIAL VIRUS FROM CLONED NUCLEOTIDE SEQUENCES

NUMBER OF SEQUENCES: 1

CORRESPONDENCE ADDRESS: 1

CORRESPONDENCES: 1

CONFORMENT: Two Embarcadero Center, 8th Floor

STATE: CA

COUNTRY: U.S.A.

CONFORMER: Tan Paradisco

COMPUTER READABLE FORM:

MEDIUM TYPE: IBM PC compatible

COMPUTER: IBM PC compatible

COMPUTER: Patentin Release #1.0, Version #1.25

CURRENT APPLICATION DATA:

FILING DATE: 27-SEP-1996

CLASSIFICATION: 424

FRIOR APPLICATION DATA:

                                                                                                                                A novel multimeric hybrid gene is used as a vaccine. The gene consists of two gene sequences which are linked and encode antigenic regions, these two sequences being derived from two different pathogens (parainfluenza virus (PIV) and respiratory syncitial virus (RSV)). The gene sequences that are particularly used are those which encode PIV-3 F and HN proteins (AAQ45684) and RSV F and (Updated on 25-MAR-2003 to correct PN field.)

The G protein is placed under the control of alternative signal and expression sequences, for example the chimeric G protein produced may also comprise the signal peptide of tissue plasminogen activator (tPA). The recombinant vector may also comprise sequences upstream of the G protein gene which enhance the G proteins generate antibodies directed against the RSV G protein will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Immunogenic composition for generating antibodies against respiratory syncytial virus - comprises non-replicating vector containing the protein G sequence, useful in protective vaccines and to raise antibodies for diagnosis

                                                                                                                                                                                                                                               Production of human respiratory syncytial virus glyco-protein F or G
- by culturing eukaryotic host cells transfected with corresponding
DNA.
                                                                                                                                                                                                                                                                                                                                                                      The present sequence was used in the development of a novel method for the production of human respiratory syncytial virus (HRSV) glycoprotein F (gpF) or glycoprotein G (gpG). The method comprises culturing eukaryotic host cells transfected with an isolated DNA sequence encoding HRSV gpF or gpG. The gp can be used to prepare

                                       The sequences of mRNA encoding HRSV structural proteins are given in AAQ29622-26. The proteins are F, G, 22K, 9.5K and major capsid protein N. The sequences and encoded proteins are useful for preparing vaccines against HRSV. The vaccines can be used to confer immunity against respiratory tract infections on human subjects.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence was used in the preparation of a novel polynuclectide, comprising an antisense oligonuclectide, with a hydroxy group at one end, that is complementary to 15-20 bases of the anti-genomic RNA strand of a respiratory syncytial virus (RSV), a linker attached to the OH-end of the antisense oligonuclectide and an oligonuclectide activator of RNaseL attached to the linker. The polynuclectide can be used to treat RSV infections, which can also be treated by administration of the antisense oligonuclectide, so as to form a complex with activated RNase L in vivo. The polynuclectide can be transported across the cell membranes without carriers or permeability agents, and once introduced destroys antisense target RNA. It also inhibits RSV infection in vitro in a superior manner to the conventional drug, ribavirin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              respiratory syncytial virus (RSV) D46. The genome is negative-sense; the complete nucleotide sequence of the wild-type B-1 virus has also been determined (see AAV17552). A novel infectious recombinant RSV comprises a RSV genome or antigenome, a major nucleocapsid (N) protein, a nucleocapsid phosphoprotein (P), a large polymerase protein (L), and a RNA polymerase elongation factor, where the recombinant RSV has at least two attenuating mutations, one of the mutations specifying temperature-sensitive (ts) substitution at amino acid Phe521,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This is the 5'-3' positive sequence nucleotide sequence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Teng

                                                                                                                                                                                            Infectious respiratory syncytial virus particles - useful for treatment of RSV or gene therapy of upper respiratory tract diseases
                                                                                                                                                                                                                                                                              A human respiratory syncytial virus (RSV) anti-genome sequence (AAT63430) is the 5' to 3' positive-sense sequence of RSV; the genom itself is negative-sense. It was synthesised in segments by RT-PCR using intracellular RSV mRNA or genomic rRNA isolated from purified viruses as template. Restriction site markers were intoduced by incorporating the changes into the primers used for RT-PCR. The recombinant sequence can be expressed with a nucleocapsid protein, a large polymerase protein and an an uncleocapsid phosphoprotein, a large polymerase protein and an RNA elongation factor to produce isolated infectious RSV particles useful for generating vaccines against RSV. Recombinant RSV genome or antigenome can also be used as a vector for gene therapy of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DB 18; Length 15223;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            360
Gin831, Metil69 or Tyri321 in the RSV polymerase gene or a ts nucleotide substitution in the gene-start sequence of gene M2.
Also claimed are: (1) an isolated infectious RSV particle which comprises a recombinant RSV (anti) genome, N, P, and L proteins, a RNA polymerase elongation factor, where the (anti)genome is modified: (i) to ablate or modulate expression of a SH, NSI, NS2 or G gene or a cis-acting regulatory sequence; and (11) by a termination codon introduced within a selected gene, or by a change in sequence, position or presence of a GS or GB transcription signal relative to the selected gene; (2) an expression vector; and (3) an RSV strain selected from cpts RSV 248 (Arcc WR 2450), cpts 248/404 (Arcc VR 2451) cpts RSV 530 (Arcc VR 2452), cpts RSV 530/1009 (Arcc VR 2451) or cpts 530/1009 (Arcc VR 2451) or cpts 530/1009 (Arcc VR 2451) or cpts 530/1009 (Arcc VR 2452) or B-1 cp52/2B5 (Arcc VR 2451) or cpts 530/1030 (Arcc VR 2452), or B-1 cp52/2B5 (Arcc VR 2451) or cpts 530/1030 (Arcc VR). The isolated attenuated recombinant RSV and RSV particles are used in a vaccine to stimulate the immune system of an individual to induce to stimulate the immune system of an individual to induce to stimulate the immune system of an individual to induce to stimulate the immune system of an individual to induce to protection against RSV. The expression vector of (2) is used for the production of infectious attenuated RSV particles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61 CACTCTCAATCATTAATTATTCATATCATCGGGCTTATATAAAGTTAAAATCTTAAATCTGT 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AATCAGCTTCTCCAATCTGTCTGAAATTACATCACAAACCACCACCATACTAGCTTCAAC 360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                sequence of human respiratory syncytial virus (RSV); the genome itself is negative-sense. This antigenome cDNA, termed D46, was structested in segments by RT-PCR using synthetic oligonucleotides as primers and intracellular RSV mRNA or genome RNA isolated from purified virions as template. The antigenome includes a S'-terminal noriviral Gtriplet contributed by the T7 promoter, 4 sequence markers (see AAA88745-47) at positions 1099 (which adds 1 nucleotide to the length), 1139, 5611 and 7559, a ribozyme and tandem T7 terminators, and a single norviral 3'-phosphorylated residue contributed to the 3' end by ribozyme cleavage. The invention provides an isolated infectious chimeric RSV comprising a major nucleocapsid (N) protein, a nucleocapsid phosphoprotein (P), a nucleocapsid (N) protein (L), an RNA polymerase elongation factor, and a partial or complete RSV genome or antigenome of one RSV strain or subgroup virus. The chimeric RSV is a chiferent RSV strain or subgroup virus combined with a heterologous gene of a chiferent RSV strain or subgroup virus. The chimeric RSV is a nutations. It is useful as a vaccine against RSV, which causes diseases such as pneumonia and bronchiolitis in infantes. The chimers system of an individual is stimulated to induce protection against natural RSV infection, preferably in a multivalent manner to achieve protection against multiple RSV strains and/or subgroups.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9

                                                                                                                                                        The present invention relates to a chimeric nucleic acid construct comprising: a nucleotide sequence adapted for protein expression in plants; and a respiratory syncytial virus (RSV) coding sequence encoding an RSV protein or an antigenic protein or peptide of RSV. The construct can be used to immunize animals and humans against respiratory syncytial virus. The use of transgenic plants to generate the antigen allows the production of greater amounts of

The invention relates to a recombinant Sendai virus comprising an exogenous nucleic acid encoding a paramyxovirus (PWV) protein or its antiquenc fragment. The virus may be administered in combination with an antiviral chemotherapeutic compound. Two or more viruses expressing different PWV proteins nay be co-administered. Compositions comprising the virus are useful for eliciting a humoral and/or cellular immune response to a PWV in a mammal, particularly a human. Further a recombinant Sendai virus comprising an exogenous nucleic acid encoding a second PWV protein is also administered and priming and/or boosting humoral or cellular immune response comprises administering one or more of a recombinant or isolated PWV protein or its antigenic fragment, a DNA vaccine encoding the same, and a non-Sendai viral vector encoding a PWV protein. The recombinant virus is useful as an effective vaccine against hPIV or RSV (the major causes of paediatric respiratory disease) and also to express any gene of impact on impaired cells, Mild-type globin gene transfer (i.e. gene therapy) into stem cells effects a cure for sickle cell disease or beta-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             thalassaemia. The recombinant virus may also prove effective in conferring immunity to human immunodeficiency virus (HIV) infection. The Sendai virus replicates at level that is high enough to induce sufficient immunity, but does not cause any harm to human recipient. The present sequence encodes a respiratory synctytial virus (RSV) G protein (heavily glycosylated protein), a PMV protein suitable for expression by the recombinant virus of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ģ

The specification describes a composition comprising a polynucleotide consisting of an antisense oligonucleotide containing a hydroxy group, complementary to the genomic or antigenomic strand of a negative-strand RNA virus, and an activator of RNSse L. The polynucleotide is used to inhibit, or treat, infection by negative-strand RNA viruses, specifically respiratory syncytial virus (RSV) but also (para)influenza, mumps, and rables. The polynucleotide can cross cell membranes without requiring carriers or permeabilizing agents, and can selectively cleave the RNA targeted by the oligonucleotide. The present sequence represents New composition useful for inhibiting or treating infections against negative-strand RNA virus Sequence 15210 BP; 4232 A; 2351 C; 2700 G; 5919 T; 8 other; PF; Torrence G, Player MR, Silverman RH, Disclosure; Fig 1; 98pp; English. produced may also comprise the signal peptide of tissue plasminogen activator (LPA). The recombinant vector may also comprise the signal peptide of tissue plasminogen activator (LPA). The recombinant vector may also comprise sequences immunoprotective ability. The resulting immunogenic composition will agenerate antibodies directed against the RSV G protein when administered to a host organism. The composition is useful as a vaccine to immunise against RSV-associated disease, particularly by usual immunisation and cell fusion methods.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Such that when an in-frame fusion is made, the resultant fusion protein may be transported to, and anchored in, a mammalian cell membrane where it can be exposed to the host immune system.

Insertion of pneumococcal surface protein A (PspA) coding sequence created plasmid pKSD2601 intramuscular immunisation of BALB/c created plasmid pKSD2601 intramuscular immunisation of BALB/c created plasmid pKSD2601 induced protection against an otherwise lethal challenge with a capsular type 3 pneumococcus. A claimed plasmid for expression of pneumococcal epitope DNA in eukaryotic cells includes a promoter for driving expression in a eukaryotic cell ce.g. HCWV-LE, DNA encoding a leader sequence (e.g. of R&VG) and DNA encoding a leader sequence (e.g. of R&VG) and DNA encoding a pneumonoccal epitope such as PspA. The invention also provides a vaccine comprising the plasmid and a suitable carrier or diluent, and optionally one or more cytokines or DNA encoding them, or a bacterial delivery system. The vaccine is used to elicit an immunological response in a host, including humans, susceptible to pneumococcal infection or sepsis. The plasmid can also be used to express a pneumococcal epitope of interest in vitro.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       67

CC This is the complete mucleotide sequence of the wild-type B-1
respiratory syncytial virus (RSV). The genome is negative-sense;
the 5-3; positive-sense sequence of D46 is provided in AAVI7533.

CC Anovel infectious recombinant RSV comprises a RSV genome or
antigenome a major nucleocapsid (N) protein, a nucleocapsid
phosphoprotein (P), a large polymerase protein (L), and a RNA
cc antigenome a major nucleocapsid (N) protein, a nucleocapsid
phosphoprotein (P), a large polymerase gene or a te
cc dlasat two attenuating mutations, one of the mutations specifying a
temperature-sensitive (ts) substitution at amino acid Phe521,
least two attenuating mutations, one of the mutations specifying a
temperature sensitive (ts) substitution at amino acid phe521,
least two attenuating mutations, one of the mutations specifying a
temperature sensitive (ts) substitution at amino acid gene MC
C claimed are: (1) an isolated infectious RSV particle which
cc comprises a recombinant RSV (anti)/genome, N), P, and L proteins, a
comprises a recombinant RSV (anti)/genome, N), P, and L proteins, a
c ais-acting regulatory sequence; not a SH, NSI, NS2 or G gene or
c c acis-acting regulatory sequence; or by a change in sequence,
the selected gene; (2) an expression of a SH, NSI, NS2 or G gene
cc c acis-acting regulatory sequence; or by a change in sequence,
the selected from opts RSV 248 (ATCC WR 2450), opts 248/404 (ATCC WR
CC 2454), cpts 248/955 (ATCC WR 2451) or cpts 530/1009 (ATCC WR 2451) or cpts 530/1009 (ATCC WR 2451) or cpts 530/1009 (ATCC WR 2542) or settenuated recombinant RSV and RSV particles are used in a vaccine
cc attenuated recombinant RSV and RSV particles are used in a vaccine
cc attenuated recombinant RSV and RSV particles are used in a vaccine
cc protection against RSV. The expression vector of (2) is used for
the production of infectious attenuated RSV particles.

Nucleotide sequences for the gene junctions of human respiratory syncytial virus reveal distinctive features of intergenic structure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Reprint for [2] and clean copy sequence for [12], [5] kindly provided by P.Collins, 21-FBB-1986.
Respiratory syncytial virus is a negative-strand RNA pleomorphic enveloped virus of the genemovirus. The matrix protein has no homology with the matrix proteins of other negative-stranded RNA viruses, implying that RS virus has undergone extensive evolutionary divergence. Two unidentified reading frames which potentially encode proteins were located: one overlaps the matrix protein and the other the F protein. The biological significance of these two reading frames is not clear. The positive strand is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             11 (bases 1 to 528; 552 to 1050)
